Trustworthy and auditable grid power: managing multi-virtual power plant operations using blockchain**M Ribeiro, J Barata, PR da Cunha - Sustainable Energy Technologies and ...**, 2026

Virtual power plants (VPP), microgrids, and distributed energy resources are changing the landscape of energy production by deploying networks of small-scale energy producers and storage resources. There are experiments using blockchain to store essential VPP information, but research is fragmented and primarily addresses financial transactions, with few studies advancing the infrastructure operation. This paper presents a systematic literature review of blockchain-based VPP operation ...

**[HTML] Poisoning resilient federated learning for secure internet of medical things a systematic review****A Unbreen, H Naeem, SR Hassan, AS Hassan - Discover Artificial Intelligence**, 2026

The current trend of the Internet of Medical Things (IoMT) has facilitated intelligent healthcare, including real-time monitoring, remote diagnosis, and data-driven clinical decision support. This substantially increases the attack surfaces of medical cyber-physical systems. As a privacy-conserving paradigm, Federated Learning (FL) has been proposed to enable distributed IoMT devices to collaboratively train models without exchanging raw medical data. However, FL-based IoMT systems are highly ...

**[PDF] Nothing to Dread: A Measurement Study of a Dark Web Social Forum****M Sundriyal, J Kim, W Dong, W Lee, M Cha - Proceedings of the 2026 ACM Internet ...**, 2026

The underground economy of the dark web is sustained not merely by markets but by resilient social groups that coordinate anonymously without institutional oversight. While prior research has focused on specific activities such as cryptomarkets, illicit services, and law enforcement interventions, the dark web as a broader social ecosystem remains largely underexamined. To bridge this gap, we present a large-scale measurement study of Dread, the most prominent dark web social forum, active ...

**[PDF] Cohort: Decentralized PIR****J Weiss, Y Gilad - Proceedings of the ACM SIGOPS 32nd Symposium on ...**, 2026

Private Information Retrieval (PIR) underpins privacy-preserving applications such as private content delivery, contact discovery, and anonymous advertising, where users need to discreetly query a database. However, PIR usually relies on expensive fully homomorphic encryption and scales poorly with the database size, making it difficult to deploy at scale. As a result, most PIR-based systems are expected to have a single provider, or a few, bearing the operational costs of running a limited number ...

**Identity-Based Stealth Addresses: Enhancing Convenience and Regulation in Blockchain****Y Zhou, W Dai, L Jiang, X Dai, D Zou - IEEE Internet of Things Journal**, 2026

The rapid growth of cryptocurrencies has led to a heightened demand for privacy solutions. Cryptocurrencies utilizing the UTXO model emphasize user anonymity. Stealth Address (SA) technology simplifies privacy by enabling one master address

to generate unique and untraceable addresses for each transaction. However, complete anonymity presents challenges. For businesses that accept cryptocurrency payments, the risk of fraud increases since transactions cannot be reversed, and ...

6G network security via federated AI and trust-aware access control for privacy preservation

SEL Khediri - Computer Communications, 2026

The 6G networks are predicted to be based on artificial intelligence (AI) to support autonomous working, self-organization, and real-time decision making. Nevertheless, the extremely distributed, data-intensive, and heterogeneous characteristics of 6G settings pose significant problems with information privacy, data security, and node reliability. The extremely low latency requirements and the number of connected devices make traditional centralized security mechanisms no ...

[PDF] Evolution of Market Microstructure in the Age of AI

I Aldridge - arXiv preprint arXiv:2609.33058, 2026

Market microstructure studies how trading rules turn orders into prices and allocations. Those rules have been rebuilt repeatedly: for floor traders, electronic limit order books and high-frequency trading, batch auctions and dark pools, blockchains run by automated market makers and block builders, and now AI agents that discover, pay for, and compete over resources. This survey traces that evolution through one question: can a market allocate scarce goods efficiently and fairly ...

[PDF] Crypto Price Similarity: An Investigation Using Pearson Correlation and Dynamic Time Warping

OB Doğan, FS Kurnaz - arXiv preprint arXiv:2609.32611, 2026

The cryptocurrency market's volatility and complex price dynamics challenge portfolio diversification and risk management. This study examines price similarity across 347 cryptocurrencies from March 2020 to April 2024 using daily OHLCV data from the Binance API. Daily dynamics are summarized via a signed, capped intraday price-range metric, and pair similarity is assessed using the Pearson cross-correlation coefficient, capturing linear co-movement at a given lag, and Dynamic ...

Adaptively Secure Fast Settlement with Dynamic Participation and Self-healing

A Kiayias, A Russell - Security and Cryptography for Networks

An important property of blockchain systems is the time it takes for a block to enter the irreversible part of the chain, which is typically captured by the notions of finality or settlement. To date, only Nakamoto-style protocols are known to simultaneously offer (1) resilience against adaptive adversaries controlling up to less than half of the underlying resource (such as stake or computational power), (2) dynamic participation (where parties join and leave at will without announcement), and (3) self ...

[PDF] Razvoj decentralizirane aplikacije za rezervaciju smještaja uz integraciju umjetne inteligencije

M Pušeljić - 2026

SAŽETAK U ovom diplomskom radu razvijena je mrežna aplikacija (engl. web application) mStay za rezervaciju smještaja koja povezuje tehnologiju lanca blokova (engl. blockchain), pametne ugovore, relacijsku bazu podataka i umjetnu inteligenciju. Aplikacija omogućuje objavu i pregled smještaja, izradu i upravljanje rezervacijama, ostavljanje recenzija te nagrađivanje korisnika vlastitim digitalnim žetonom (engl. token) mStayCoin. Pametni ugovori koriste se za izvršavanje ključnih ...
