GENKIDAMA: Cross-Chain Rollup for Scalable Blockchain Interoperability

Y Qin, D Jiang, Z Hong, W Chen, J Zhang, Z Zheng... - IEEE Transactions on ..., 2026

Cross-chain bridges allow users to exploit the profit opportunities of multi-chain Web3 systems. However, existing solutions face scalability challenges because they require a chain of proofs generated by intensive cryptographic computations (eg Zero-Knowledge Proofs (ZKP)) to synchronise all block states from one blockchain to another. The lack of proof for any block creates uncertainty about subsequent blocks' validity due to the blockchains' chain structure. Therefore, we present GENKIDAMA ...

PDF A Global Blockchain-IoT Architecture Integrating Layer-2 Protocols

M Aghroud, Y El Gountery, M Oualla, L El Bermi... - Engineering, Technology & ..., 2026

Integrating blockchain technology into Internet of Things (IoT) environments faces significant scalability and transaction-processing challenges associated with Layer-1 (L1) architectures. This study proposes a blockchain-IoT architecture centered on an adapted PoAh-based Layer-2 (L2) validation and aggregation mechanism and discusses Zero-Knowledge (ZK)-rollups and Optimistic rollups solely as comparative analytical approaches. In the proposed architecture, the Proof of Authentication ...

A machine learning framework for multi-market portfolio optimization: Evidence from US stocks and cryptocurrencies

P Peykani, D Sabour, C Tanasescu - An International Journal of Optimization and ..., 2026

This study presents an integrated framework for multi-market portfolio optimization that integrates machine-learning-based return forecasting with classical and downside-oriented risk models. Using daily data for Bitcoin, Ethereum, BNB, Microsoft, and Tesla, the XGBoost algorithm is employed to predict short-term returns, after which the forecasts are used to construct optimal portfolios under the Mean-Variance (MV), Mean-Semi-Variance (MSV), and Mean-Absolute Deviation ...

PDF A Layered Security Framework for Blockchain-Based IoT Systems

D Commey - 2026

Abstract Integrating the Internet of Things (IoT) with blockchain expands the attack surface and intro-duces new security challenges rooted in device heterogeneity and tight resource budgets. Securing these Blockchain-based IoT (BloT) systems requires addressing critical vulnerabilities at the de-vice, network, and data layers, which traditional methods often fail to resolve, particularly with respect to scalability, privacy, and emerging threats from quantum computing. This dissertation addresses ...

Secure, Intelligent, and Sustainable AI-Driven Frameworks for Cyber-Physical Systems in Healthcare, Cloud, and IoT Environments

AM Nair, IU Khan - 2026 2nd International Conference on Innovations in ..., 2026

The fast development of Artificial Intelligence (AI), Internet of Things (IoT), The new cyber-physical systems rely on technologies such as cloud computing, and blockchain technologies. In the fields of healthcare, industrial automation and smart infrastructure systems. While These technologies facilitate intelligent automation,

predictive analytics and intelligent decision-making. They also allow for real-time communication, putting systems at risk for security vulnerabilities. GDPR can also be ...

Measuring and Mitigating Traditional Threats Targeting Cryptocurrency Ecosystems

M Muzammil - 2026

Instead of interacting with the underlying blockchains directly, cryptocurrency users typically rely on an ecosystem of user-facing infrastructure and software, such as naming services, digital wallets, and decentralized applications. This ecosystem has increasingly converged on the same infrastructure and design patterns as the traditional web, and, as a result, inherits many of the same security and privacy vulnerabilities that have long affected web users. Despite this risk, the prevalence ...

Blockchain-Driven Federated Learning for Privacy-Preserving Smart Classrooms: A Decentralized Education Framework

J Saxena - ... , Federated Learning, and Metaverse Ecosystems Into ..., 2027

The adoption of data driven technologies in education has raised concerns about privacy, transparency and trust in centralized education systems. Artificial intelligence and learning analytics are used to personalized learning, however, their reliance on centralized data systems raises questions about privacy and security of sensitive student data. This research tackles these issues by envisioning a decentralized smart classroom employing federated learning and blockchain ...

[PDF] Med-Chain: A Privacy-Preserving Blockchain–Cloud Hybrid Framework for Secure Healthcare Data Validation Using zk-SNARKs

T Anjum, MM Big, S Sawwashere, S Sonekar - Science and Technology, 2026

Electronic Health Records (EHRs) demand simultaneous guarantees of confidentiality, verifiable integrity, patient-controlled access, and regulatory auditability—guarantees that neither centralised cloud storage nor fully on-chain blockchain systems can jointly provide. Cloud platforms concentrate trust and deny patients verifiable audit; blockchains cannot economically hold bulk medical data, and their transparency leaks patient–provider interaction patterns. Hybrid ...

[HTML] Extensive Comparison of Topic Modeling Techniques and Tracking Cryptocurrency Trends

H Doan - 2026

Cryptocurrency is an asset that's widely recognized for trading and investment. Although we observe substantial increases in value exemplified by Bitcoin's price exceeding thousands of US dollars, there have been factors leading to equally devastating plummets in price that have occurred. Despite available information such as market caps and historical prices, it's challenging to assess its worldwide impact since brief inspection of current prices would be insufficient. Knowledge of events ...

Decentralized Learning Management Systems (DLMS) Architecture and Design

P Yadav, J Kumari, CP Bhargava - Integrating Blockchain, Federated Learning, and ..., 2027

Conventional learning management systems suffer from increasing constraints on account of administrative restrictions, problems associated with the issue of data ownership, vendor lock-in, and security concerns. Decentralized learning management systems present an exciting paradigm shift in that they utilize distributed ledger technology, including the implementation of blockchain, peer-to-peer networks, self-sovereign identity, and decentralized storage to facilitate learner ...
