Feather: A Two-Phase Propose-and-Endorse Consensus Protocol for Asynchronous Blockchains[X Luo, J Zheng, H Huang, Z Yin, G Ye, B Xiao - IEEE Transactions on Computers, 2026](#)

BFT-like consensus protocols have two drawbacks: i) their three-phase synchronization latency is high, and ii) the communication overhead among consensus nodes is high. Consequently, we are motivated to design a lightweight consensus that enables low-communication asynchronous operations. To this end, we present a new consensus protocol, Feather, which is lightweight and enables asynchronous blockchains. Feather employs a two-phase propose-and-endorse ...

**[PDF] Between Blockchain and Black Markets: South Africa's Legal Readiness for Crypto-driven Cyberfraud**[S Mabunda, Y Chande - Communications of the IIMA, 2026](#)

This paper examines whether the proliferation of cryptocurrency-facilitated fraud warrants a reclassification of the terrestrial crime of fraud into the distinct statutory offence of cyberfraud under South African law. Engaging with established fraud typologies—exit scams, Initial Coin Offering (ICO) scams, Ponzi schemes, pump-and-dump schemes, and market manipulation—the article tests their definitional fit against both the common law of fraud and section 8 of the Cybercrimes Act 19 of ...

**BSV Blockchain as Big Data Infrastructure: Distributed Consensus, Terabyte Blocks, and Billion-Transaction Throughput**[CS Wright - 2026 7th International Conference on Big Data ..., 2026](#)

Public blockchain networks are conventionally treated as financial ledgers constrained by throughput limitations. This paper reframes the BSV blockchain and its Teranode architecture as a big data infrastructure: a globally distributed, append-only, Merkle-indexed data platform whose scaling trajectory follows established principles of distributed systems engineering. We present an architectural analysis of Teranode's role-decomposed pipeline, in which transaction validation, block ...

**Cryptographic Proof Ingestion at Scale: Integrating Blockchain Verification Events into Enterprise Streaming Pipelines**[CS Wright - 2026 7th International Conference on Big Data ..., 2026](#)

When enterprises adopt blockchain settlement for micropayments, each confirmed transaction produces a cryptographic verification event—a block header, a Merkle inclusion proof, and associated metadata—that must be ingested, verified, reconciled with internal state, and persisted for audit. At scale, this verification data constitutes a streaming big data workload with distinctive properties: fixed-size headers (80 bytes), logarithmically-scaling proofs (26-40 hashes for 10^5 - 10^9 transactions per block) ...

**Data-Driven Micropayment Routing: Cost-Curve Analytics, Streaming Surveillance, and Dual-Rail Decision Engines**[CS Wright - 2026 7th International Conference on Big Data ..., 2026](#)

Micropayment platforms that route all transactions through a single legacy processor lose up to 71.65% of sub-five-dollar volume to effective fees exceeding 10% of transaction value—a routing inefficiency, not a pricing inevitability. This paper formalises micropayment routing as a streaming big data analytics problem and proposes a three-layer framework: structural cost-curve models that derive value-dependent breakeven thresholds across heterogeneous rails, cumulative sum ...

[PDF] The From Individual Cognition to Organizational Readiness: A Dual-Level Framework for Blockchain Adoption in Public and Private Sector Organizations

S Ali - *Journal of Intelligent Decision Making and Information* ..., 2026

The blockchain technology has evolved to become an online engine that can facilitate diverse government and business solutions. Although aware of its benefits, there is still low use of it and adoption is low among organizations. Previous research used technology oriented and linear theoretical frameworks, including TAM, UTAUT and TOE, which failed to consider the human dimension in the use of technology. These views are transformed into organizational commitment. This research paper ...

[PDF] Application of Blockchain Technology in a Prototype for Complaint Management at Family Police Stations: A Case Study of Fusagasugá, Colombia

LF Castañeda, JE Camargo - *Interfaces*, 2026

In the public sector, administrative procedures generate case files that are traditionally stored in physical archives or relational databases. Ensuring the authenticity, reliability, and integrity of these records is critical to achieving the mission of Colombian Family Police Stations (Comisariías de Familia), which protect and restore the rights of family members affected by intra-family violence. Nevertheless, conventional information systems can be vulnerable to falsification ...

[PDF] INDUSTRY 4.0 AND THE FUTURE OF COMMERCE: ECONOMIC IMPLICATIONS FOR INDIA

D Kundu, S Talukdar

ABSTRACT Industry 4.0, characterized by the convergence of advanced digital technologies such as Artificial Intelligence (AI), Internet of Things (IoT), Big Data, blockchain, and robotics, is fundamentally reshaping global industrial and economic landscapes. This paper deeply explores the profound economic implications of Industry 4.0 for India's burgeoning commerce sector. As India stands at a critical juncture of digital transformation and economic growth, understanding how these ...

[PDF] Blockchain-Enabled Digital Twin and AI Framework for Real-Time Risk Assessment, Quality Assurance, and Decision Intelligence in Financial Systems

P Thomas, J Michael, H Joy

The rapid digitization of financial services has produced increasingly interconnected systems in which transactions, customer activities, regulatory processes, cybersecurity events, and operational decisions generate large volumes of data in real time. Traditional financial riskmanagement approaches often depend on historical reports, static rules, and fragmented information systems, making it difficult to identify emerging risks and respond rapidly to changing conditions. At the same ...

[PDF] A Unified AI and Digital Twin Framework for Business Process Optimization, Real-Time Decision Support, and Blockchain-Based Risk Management

P Thomas, J Michael, H Joy

The increasing complexity of digital business operations has created a need for intelligent systems capable of integrating business processes, operational data, predictive analytics, risk assessment, and real-time decision-making. Conventional business process management approaches frequently represent workflow logic and decision logic separately, while financial institutions continue to face challenges involving transaction security, scalability, operational efficiency, and rapidly changing ...
