Opportunistic Sniffing-based Incentive Mechanism to Counter Transaction Withholding Attack in Blockchain

H Shi, S Wang, S Guo, X Cheng - IEEE Transactions on Networking, 2026

Transaction withholding attack (TWH) turns the positive effect of transaction fees in packaging incentive into the detrimental propagation suppression, thwarting transaction spreading and information sharing in blockchain. Moreover, such an attack not only appears at the individual level, but also proliferates at the group level, which further deteriorates the efficiency and security of blockchains. However, pioneer countermeasures in hedging TWH fall short in myopia, frustrating the self ...

[PDF] STAKE: Preventing a colluding majority from double spending

Z Naderi, V Gramoli - arXiv preprint arXiv:2610.01169, 2026

Blockchains typically operate in open networks where it is hard to control the delay of messages. While classic blockchain protocols assumed synchrony, newer protocols try to remain secure despite unexpected network delays. Unfortunately, in the traditional model where n participants can either be honest or Byzantine, we need a supermajority, or $\lfloor \frac{2n}{3} \rfloor + 1$, of them to be honest. Recent work have explored the question of reducing the number of needed honest nodes in a ...

[PDF] Blockchain Lifecycle Prediction-Dead Coins

UA Kuehn, SM Adnan - arXiv preprint arXiv:2610.01379, 2026

The cryptocurrency ecosystem has experienced extraordinary growth alongside an equally remarkable rate of failure, with over 52 percent of all tokens launched since 2021 ceasing to trade by early 2025. Despite the scale of this phenomenon, predictive modeling of cryptocurrency death remains an underdeveloped area of research, constrained by definitional ambiguity, data scarcity, and the absence of granular lifecycle frameworks. This work investigates whether the failure of ...

Towards Resilient Cloud Storage: a Defense-Indepth Framework for Mitigating Insider Threats and External Cyberattacks

R Mahule, P Ukhalkar - 2026 10th International Conference on Computing ..., 2026

The advent of cloud computing has made cloud storage an essential part of today's digital environment that is widely used in healthcare, finance, and public sectors among others to store sensitive information. Nevertheless, the widespread use of cloud storage solutions creates additional risks for the stored information, making it vulnerable to attacks from both external actors, such as ransomware actors and nation-state advanced persistent threats (APTs), and malicious or negligent insiders ...

A Secure Blockchain-Based E-Wallet System Using AES-Based Encrypted Transaction History

DI Pramadhan, A Zainudin, A Sudarsono - 2026 International Electronics Symposium ..., 2026

This paper proposes a secure, hybrid e-wallet system to address the confidentiality, integrity, and auditability risks inherent in conventional centralized payment architectures. The proposed solution combines off-chain MongoDB storage for

operational data with AES-256-GCM encrypted on-chain transaction logs deployed on a permissioned Hyperledger Besu blockchain. RSA-based key protection ensures encryption keys remain secure, while an administrative audit mechanism verifies ...

[PDF\] Mercati, infrastrutture, sistemi di pagamento](#)

M Nardelli, F De Sclavis, M Iezzi - 2026

As digital payment systems evolve, protecting privacy has become one of the main design challenges. On the one hand, digital transactions should protect users from unwarranted monitoring and data misuse. On the other, regulatory compliance requires mechanisms for oversight, traceability, and accountability. Balancing these objectives is particularly complex in institutional payment infrastructures, where public trust and regulatory responsibilities must coexist. This paper provides an ...

[Metodologi PLS-SEM, Necessary Condition Analysis+ Fuzzy Set QCA: Panduan Komprehensif dari Fondasi Filosofis ke Praktik Nyata](#)

H Mu'min, TS Kaihatu, D Bernardus - 2026

Buku Metodologi PLS-SEM, Necessary Condition Analysis+ Fuzzy Set QCA: Panduan Komprehensif dari Fondasi Filosofis ke Praktik Nyata membahas tiga pendekatan analisis yang semakin penting dalam kajian manajemen dan ilmu sosial, yaitu Partial Least Squares Structural Equation Modeling (PLS-SEM), Necessary Condition Analysis (NCA), dan Fuzzy Set Qualitative Comparative Analysis (fsQCA). Pembahasan disusun mulai dari landasan filosofis, teori ...

[An Adaptive Trust Aware Consensus Framework for Resource Constrained Blockchain Networks: Performance Evaluation and Security Analysis.](#)

V Mani, S Jaiswal - [International Journal of Performability Engineering](#), 2026

The introduction of blockchain technology is thought to be among the finest methods for ensuring the security of distributed systems. However, conventional consensus mechanisms like Proof of Work (PoW), Proof of Stake (PoS), and Practical Byzantine Fault Tolerance (PBFT) entail heavy energy, computational, and communication costs. Therefore, the implementation of such consensus mechanisms in resource-constrained environments including the Internet of Things (IoT) and edge computing ...

[TornaLink: Toward Linking Tornado Cash Deposits to Withdrawals via DeFi](#)

B Qin - [Provable and Practical Security: 20th International ...](#), 2026

Blockchain systems now carry substantial crypto asset value and dense DeFi activity, increasing the forensic burden associated with public ledgers. Once an attack occurs on chain, analysis often moves from vulnerability diagnosis to tracing stolen assets; at that point, mixers such as Tornado Cash obscure direct public linkage between deposits and withdrawals and expand the candidate set sharply. Existing Tornado Cash deanonymisation methods tend to rely on low level evidence: transaction ...
