Cryptocurrency adoption in hospitality and tourism: A qualitative study from technological, financial, and E-commerce perspectives

LH Le, M Hancer, AB Ozturk, T Zhang, F Ali - Tourism Management Perspectives, 2026

While cryptocurrency helps lower transaction costs, enhance security, and reduce fraud for hospitality and tourism transactions, its use as a payment method remains limited. Prior research has examined cryptocurrency adoption through technology acceptance models and focused on Asian and European contexts, providing limited understanding of its broader financial and e-commerce considerations. This study addresses these gaps by conceptualizing cryptocurrency adoption as a …

[PDF] It Takes Two: Proofs of Work for Fiat–Shamir

B Bünz, J Chen, Z Guan - Cryptology ePrint Archive, 2026

In the random oracle model (ROM), proof of work (PoW) serves two roles in the Fiat–Shamir transformation. First, in challenge grinding, the prover must solve a puzzle for each candidate challenge, which amplifies soundness and reduces proof size and verifier time. This requires a non-amortizing PoW: computing $ k $ distinct accepted puzzle–solution–proof triples costs, in expectation, roughly $ k $ times the work of computing one. Second, PoW can prevent diagonalization attacks, in which the …

[PDF] RACC: Trust Governance for Heterogeneous Multi-Agent Networks

J Huang, Y Liu, J Huang, S Liu - IEEE Open Journal of the Communications Society, 2026

A large-scale multi-chain Internet-of-Things (IoT) ecosystem can be viewed as a networked multi-agent system in which autonomous agents interact across heterogeneous subchains and must sustain consistent cross-organization trust. In such systems, the cross-chain consensus protocol serves as the coordination infrastructure for interoperation and is increasingly critical to both security and performance. To address three technical bottlenecks faced by existing protocols …

Adaptively Secure Fast Settlement with Dynamic Participation and Self-healing

C Badertscher, S Coretti, P Gaži, A Kiayias, A Russell - International Conference on …, 2026

An important property of blockchain systems is the time it takes for a block to enter the irreversible part of the chain, which is typically captured by the notions of finality or settlement. To date, only Nakamoto-style protocols are known to simultaneously offer (1) resilience against adaptive adversaries controlling up to less than half of the underlying resource (such as stake or computational power),(2) dynamic participation (where parties join and leave at will without announcement), and (3) self …

Hacia sistemas inteligentes descentralizados: Evidencia bibliométrica sobre blockchain y agentes de inteligencia artificial.

G Terán-Rosero - Revista de Ciencias Sociales (13159518), 2026

The convergence of blockchain technology and artificial intelligence agents constitutes one of the most dynamic frontiers of contemporary digital transformation. This integration promises autonomous, decentralized, and verifiable systems

capable of operating without intermediaries in domains such as decentralized finance, smart supply chains, algorithmic governance, and the Internet of Things. This study aims to map the scientific output on the intersection of blockchain and …

Modeling and Performance Evaluation of a Hyperledger Fabric-Based Architecture for Retail Central Bank Digital Currency Systems

A Nugroho, SH Supangkat, AA Arman - 2026 13th International Conference on ICT for …, 2026

Central Bank Digital Currency (CBDC) is increasingly explored by monetary authorities as a digital, sovereign-backed alternative to cash and private cryptocurrencies for retail payments. This paper presents an architecture for a retail CBDC system built on Hyperledger Fabric, a permissioned blockchain platform, and evaluates its transaction performance against a conventional non-blockchain baseline. Using a systematic literature review, we synthesize existing CBDC access …

Formal Verification in Modern Technologies: Safety Assurance for P2P, IoT, Blockchain, and Quantum Computing

T Lu - … : Evidenzbasierte und praxistaugliche Impulse für eine …, 2026

P2P networks, IoT, blockchain, and quantum computing are enabling major advances in smart cities, digital twins, autonomous robotics, cyber defence, healthcare, and decentralized finance. As these technologies interconnect everything from urban infrastructure to medical devices and financial markets, they promise vast economic and societal benefits. Yet, their complexity and criticality expose them to unprecedented safety and security risks. Formal verification …

[PDF] A Incidência do Imposto de Renda sobre a Permuta de Criptoativos

RM de Barros Montezano - Revista Direito Tributário Atual, 2026

No âmbito do mercado de criptoativos, em vertiginoso crescimento no Brasil, discute-se sobre a verificação de renda tributável em operações de troca de criptoativos. Embora exista certo consenso na doutrina acerca da natureza jurídica desses bens e da qualificação da operação de troca entre eles como permuta, há cisão no que tange à verificação de renda tributável na permuta entre criptoativos, havendo duas correntes com posições antagônicas sobre o assunto. O Fisco Federal, por sua vez …

[PDF] BLOCKCHAIN AS A TRANSFORMATIVE TOOL IN PUBLIC ADMINISTRATION: AN EXAMINATION FROM A NETWORK GOVERNANCE PERSPECTIVE

G Yüksel Aktuna - 2026

Blockchain technology emerged in the finance sector, claiming to be a decentralised technology that enables consensus-based decision-making, reduces the need for trust in third parties, and proposes a new coordination and decision-making process. In public administration, blockchain is primarily considered as a technology that will contribute to the more secure and efficient delivery of public services. Whether this technology, which itself is based on network governance architecture, can be used …
